Requirement	Issue
System shall allow use to perform search, set search criteria and filter workplaces, and also to sort and navigate by search results.	This requirement is quite broad and combines multiple functionalities into one. It should be broken down into smaller, more specific requirements to improve clarity and manageability.
System shall allow searching without setting search parameters.	This requirement lacks clarity about the expected behavior when searching without parameters. It should specify whether it should return all workplaces or provide some default search criteria or some error message
System shall allow searching workplaces by provided parameters.	This requirement is ambiguous and lacks specific details about the parameters. It should list the specific parameters that can be used for searching.
System shall allow searching only for the date range that is not in the past.	: This requirement is clear and specific.
System shall allow sorting search results by all available fields.	This requirement is clear and specific.
System shall validate provided data before search.	This requirement is vague and lacks specific details about the validation criteria. It should specify what kind of data will be validated and the rules for validation.
System shall provide search results without delay.	This requirement is not quantifiable and lacks specific performance criteria. It should specify a maximum acceptable response time for search results.
System shall provide flexible navigation between results.	This requirement is unclear about what is meant by "flexible navigation." It should provide specific navigation options or functionalities.
System shall provide user-friendly interface.	This requirement is subjective and not measurable. It should specify the usability features or standards that define a user-friendly interface.
Search result table shall be read-only.	This requirement is clear and specific.
